

**Hitzinger supplies a complete information software package to surveil and control a power supply system by a serial interface over a network, intranet or remote access over a modem line etc.**

1. Realtime operation information and historical data and events are completely available. The data can be shown with tailormade displays with individual blueprints, electrical wiring diagrams or mimic diagrams with system overviews up to detailed displaying single control elements

2. The powercon control unit of Hitzinger supplies tailormade reports about current or historical Data to make protocols of past events (event logging) and makes it possible to forecast future requests to operating conditions via trend analysis of loads etc. The software is an efficient tool which is also simple to use for laymen.
