

Quality Work

More and more airports and airlines tend back to traditional values as reliability, durability and valuable making. Especially for these customers we build our GPU s. Hitzinger GPU s convince by special quality and optimized function.

We take more care over something. Therefore all Hitzinger GPU s are developed in Austria and are manufactured and tested by our mechanics with an high effort on experience and meticulousness.

So we can be sure that Hitzinger GPU`s are manufactured with high precision and one principle is now as valid as yesterday:

The best part is just as good as the way it is mounted and adjusted.

Individual Systems

The wishes and needs of our customers are very different. To make sure that you find your perfect GPU there is a list of options. So we are able to adopt the GPU to your very needs.

Optimized Concept

Innovative materials, modern technologies of processing and a genius design push our GPU s to the decisive lead. Take a closer look at the concept at the ventilation concept or the well thoughtabout enclosure, which is suitable for different ways of ventilation - which provides an excellent access for service and maintenance and - in addition - the noise level is reduced to a minimum.

The concept was developed by calculations which were verified and refined in the test field and from airports. Only when everything was perfect the series production

was started.

Axel and Tires

GPU s from Hitzinger are made of almost indestructable tecnology.

Axel and tires correspond to the hard conditions of every days operation and are maintenance-free. So light running solid tires combined with steel leaf spring loaded axels are used. The proofed components convince through simple and robust handling.

Operation and Display

Hitinger Powercon is the name of our newest surveillance and control unit.

This PLC is well established by our cusomers because of simple, menue oriented operation. So you can switch faster and faulty operation proof. Many instruments and switches belong to the past.

Error logger and remote status report via modem are state of the art.
